CASE STUDY

Using the Power Platform to create an organised software system to store all crucial documents and information needed for managing a sports team.

Objectives

From basic player information to car rentals agreements, the Caledonia Gladiators needed to store their player information in one place.

They needed a system that could be used with their existing technology and as an add-on to their Microsoft Office license.

Challenges

The Gladiators had a vast amount of data to be imported to a new system, and required guidance setting up new users, and training on the new software.

This meant that the internal team needed a dependable implementation process for their new software.

Solutions

Within half a day, Proximo 3 implemented Power Sports Team Management for the women's and men's teams. After the system had gone live, the team received extensive training on the use of the system.

As a result, they now have a simple and easy to use team management system based on the Microsoft Power Platform and their Office license.

OUR BENEFITS

Benefit One
Ongoing support including software training and the addition of extra/new features required.

Benefit Two
The software supports native Teams integration allowing for users to access all they need without switching software.

Benefit Three
They only required a Microsoft Office license making it accessible to a wide range of sports clubs

The Power Sports Team Management App has allowed us to manage all aspects of the player's time at the club. With everything from issuing players contracts to allocating them properties and cars. The app has saved us time and made sure that all data is now in one place.
